Following are my thoughts on M&S Tool IOC –

Focus and purpose of the IOC game – Test and evaluate the model's ability to simulate and adjudicate ground fighting at echelon (platoon – battalion)

Vision for IOC Game:

-Model can display and simulate Platoon to Bn level formations executing fire and maneuver during offensive and defensive actions

-Model can adjudicate Blue vs RED force on force actions

-Model would produce quantitative data for analysis

-Model would incorporate all-domain capabilities that an infantry formation would plan for and execute

-Model and simulate dismounted and mounted operations

-Recommend not trying to create the model from ground up – use existing models such as MASA Sword which seems to be a decent ground fighting tool. Probably save time, effort, and money if use this model as the starting point.

-Model should be capable of being used in the following manner:

-COA planning tool

-multiple COA are run by AI – informs the players COA decision

-Players plan Blue and RED actions based on mission or scenario

-model simulates and adjudicates the plans / players watch

-Model allows for in-stride decisions and changes while simulation is executing

-Model able to conduct simulation in a Monte Carlo type style for mass number of runs

Thanks
